

Concealed Twin & Triple Thermostatic Shower Valve with Diverter

Product shown will vary depending on model

Important information:

To ensure this product is installed properly you must read and follow these guidelines.

The owner/user of this product must keep this information for future reference.

This product must be installed by a professional licensed contractor.

Only use a strap wrench or protected smooth jaw on any finished surface.

ORE

Contents:

1. *Important Information (p1)*
2. *Cleaning and Aftercare (p2)*
3. *Box Contents (p2)*
4. *Dimensions (p3)*
5. *Plumbing Connections (p4)*
6. *Installation (p5-6)*
7. *Temperature Adjustment (p6-7)*
8. *Conditions of Use (p8-9)*
9. *Fault Diagnosis (p10)*

*Please note: Products 34D and 40D;
(Diverter options) are supplied and fitted with
adjustable Diverter Spline Extensions for ease of
Handle alignment.*

1 Important information

- Thank you for purchasing this Twin/Triple with Diverter Thermostatic Shower Valve. To ensure you get the very best use from this product, please read this installation guide thoroughly.
- These Shower Valves have separate controls for temperature and water flow control, and have been designed for concealed wall installations. This product is suitable for use on all plumbing systems including gravity, pumped, fully modulating combination boilers and unvented systems.
- Please make sure that any auxilliary systems (e.g. Shower kits) are suitable for connection to this product.
- Debris in the new pipe work can get in to the Cartridges. This is easily avoided by thoroughly flushing the pipe work **before** connecting the Shower Valve to the water supplies.
- This Shower Valve is suitable for all water supply systems up to a maximum dynamic water pressure of 5 bar (**balanced water pressures are desirable for best performance**). Pressures above this limit may require the fitting of pressure reducing Valves into the incoming mains household water supply.
- This product must be installed in such a way as not to cause water damage during use. **We recommend that this product is fitted by a fully qualified installer. The installation must comply with all current water byelaws.**
- **NB. If you experience any difficulty with the installation or operation of your new Shower Valve, please refer to 'Fault Diagnosis' at the end of this guide.**

2 Cleaning and Aftercare

This product is made of Brass and is available in a variety of finishes, if you need further information on cleaning and maintenance please see our full instructions. These can be found on our website or the care slip included in the box with your product. All finishes should only be cleaned with non-abrasive products or materials and a soft cloth, and **any misuse will invalidate your guarantee.**

This precision-made Thermostatic Shower Valve will continue to give years of use provided it has been installed and operated in accordance with these fitting instructions. **Failure to do this will invalidate any guarantees.**

3 Box Contents

Please note: Handles and Plate may vary depending on model supplied.

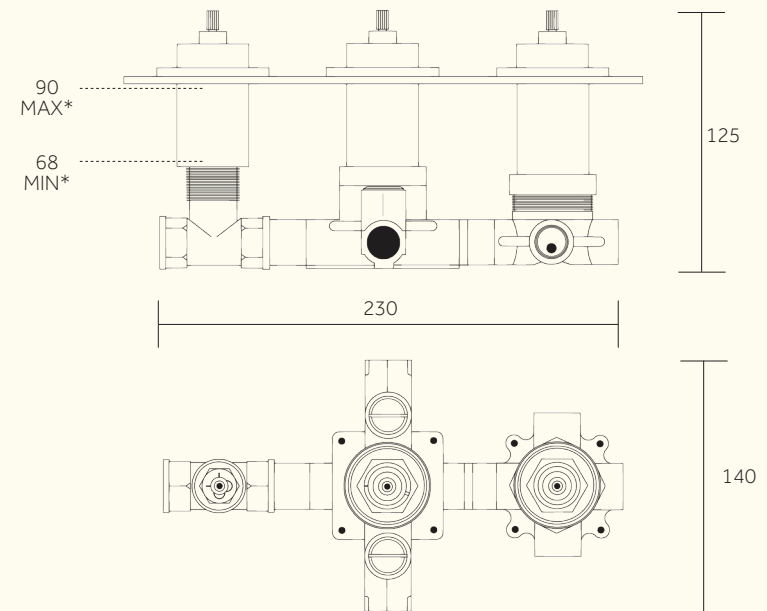

1 Main Thermostatic Shower Valve Body with Diverter Valve (and a CD Valve for the Triple Body). 2 Brass Temperature Body Sleeve. 3 Brass Control Sleeve. 4 Brass Concealing Plate. 5 Brass Thermostatic Control Handle. 6 Brass Flow Control Handle.

2

4 Dimensions

ALL DIMENSIONS ARE APPROXIMATE (mm)

*Minimum and maximum installation depth into wall

3

5 Plumbing Connections

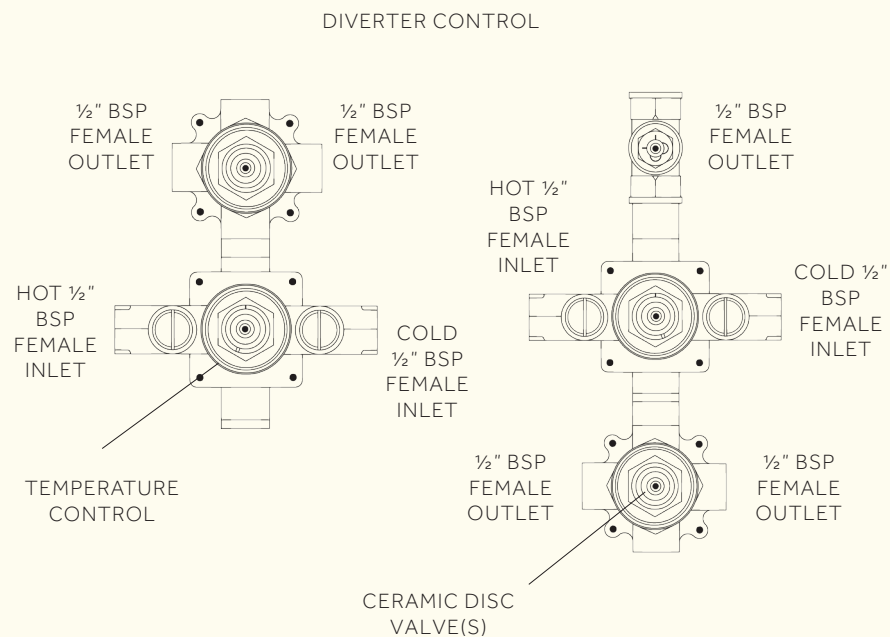

Please note that the pipe work on-site running to the Valve should be plumbed with the hot on the left and the cold on the right.

Twin Valve:

The hot inlet of the Valve must be connected to the hot pipe work.
The hot inlet of the Valve will be marked. When installed correctly the Diverter Valve will be at the top.

Triple Valve:

The hot inlet of the Valve must be connected to the hot pipe work.
The hot inlet of the Valve will be marked. When installed correctly the Diverter Valve will be at the bottom.

6 Installation

1 Before installation, please read the Conditions of Use section and ensure the supply system conditions apply.

2 Remove the Brass Sleeves from the Shower Valve body, and leave to one side in a safe place.

3 You must install accessible isolation valves in the HOT & COLD water supply lines for servicing purposes. These Valves have integral strainers in the inlets.

4 The plumbing connections on the inlets and outlet are all 1/2" BSP female threads.

5 Determine the fixing position for the Valve and make a recess in the wall to house the Valve. It should be from 68mm to 90mm deep.

6 Secure the Shower Valve body onto the wall, using the Mounting Lugs that are cast into the base of the body.

7 Now the Shower Valve body is securely mounted onto the wall, make sure the pipe work is thoroughly flushed through to remove any debris from the system before connecting the water supplies. **Failure to do this could invalidate the guarantee.**

8 The plumbing connections should then be made to the HOT & COLD water inlets (which are clearly marked).

9 Make the plumbing connection to the water outlet. This will take the water to the chosen auxiliary product (Shower kit) you have selected to run the Shower.

10 Turn on the water supply and check for leaks.

11 Check the max water temperature from the terminal fitting with a thermometer. The recommended maximum terminal outlet temperature is 41°C. If the water temperature is not suitable please see the Temperature Adjustment section. **Please Note: The mixed water temperature at the terminal fitting must never exceed 46°C.**

12 Re-fit the Brass Sleeves to the Shower body.

13 Apply a small bead of silicone behind the Brass Concealing Plate (this will give a water-tight seal so water cannot ingress into the wall cavity). Slide the Plate into position over the Brass Sleeves, and fit up against the finished wall surface. We recommend applying a small amount of silicone grease to the O-Rings on the Shower Plate, allowing it to slide on to the cylinders with ease.

14 Fit the Brass Control Handles. The Flow Control Handle is always a Lever, unless the purchaser has chosen otherwise. Please see separate Installation and Alignment guide.

15 Please see the Conditions of Use section.

7 Temperature Adjustment

1 Remove the Handle on the Thermostat Control. This can be loosened by undoing the concealed Grub Screw with the allen key supplied. Unscrew the Brass Sleeve. The Brass Stop Lug will now be exposed.

2 Turn the Shower Flow Control fully on.

6

3 If the Shower is too cold then turn the Spline anti-clockwise. If the Shower is too hot then turn the Spline clockwise. Let the water temperature stabilise after every adjustment. We recommend a max temperature of 41°C.

The mixed water temperature at the terminal fitting must never exceed 46°C.

4 When the temperature is correct turn the Flow Control off. Do not move the Spline again until after the Handle is secured in place. The maximum temperature is now set and any movement of the Spline will alter the temperature.

5 The Handle can now be put back in place. **When the Handle is being placed over the Spline, please ensure that the Handle Stop Lug is against the Cartridge Stop Lug preventing the Handle from being turned any further anti-clockwise. This prevents the Shower Valve from reaching a temperature that is higher than the set point.**

Depending on your Handle type the temperature will be limited by a Handle with an in-built Stop Lug or by a separate Cartridge Stop Lug. Please see the diagrams below.

6 The Handle can now be fixed in place. The Shower should have a safe maximum showering temperature.

7

8 Conditions of Use

CONDITIONS OF USE FOR THERMOSTATIC MIXING VALVES:

	<i>High Pressure</i>	<i>Low Pressure</i>
Maximum Static Pressure - Bar	10	10
Flow Pressure, Hot & Cold - Bar	0.5 to 5	0.1 to 1
Hot Supply Temperature - °C	55 to 65	55 to 65
Cold Supply Temperature - °C	Equal to or less than 25°	Equal to or less than 25°

Note: Valves operating outside these conditions cannot be guaranteed to operate thermostatically.

Designation of Use:

High Pressure Shower and Low Pressure Shower.

If a water supply is fed by gravity then the supply pressure should be verified to ensure the conditions of use are appropriate for the Valve.

Recommended Outlet Temperatures:

44° for bath fill but see notes below;

41° for showers;

41° for washbasins;

38° for bidets.

The mixed water temperature should never exceed 46°C. The maximum mixed water temperature can be 2°C above the recommended maximum set outlet temperatures.

PLEASE NOTE: The mixed water temperature at the terminal fitting must never exceed 46°C. It is not a safe bathing temperature for adults or children.

The British Burns Association recommends 37°C to 37.5°C as a comfortable bathing temperature for children.

The Thermostatic Mixing Valve will be installed in such a position that maintenance of the TMV and its valves and the commissioning and testing of the TMV can be undertaken.

The fitting of Isolation Valves is required as close as is practicable to the water supply inlets of the Thermostatic Mixing Valve.

On installation please make sure:

- 1 The supply pressures are within the Valves operating range.
- 2 The supply temperatures are within the Valves operating range.
- 3 Isolating Valves (and strainers preferred) are provided.

If the operating conditions are within acceptable limits and the temperature has been set correctly, please carry out a cold water failure test by turning on the mixed water flow and then isolating the cold water supply to the Mixing Valve. After 5 seconds the mixed water flow should have stopped. If there is a residual flow, this is acceptable as long as the water temperature is within +/- 2°C of the initial temperature.

Please check the set temperature once a year and also carry out the cold supply isolation test outlined above.

9 Fault Diagnosis

FAULT	POSSIBLE CAUSE
After installation, shower only runs HOT or COLD.	1. Hot and cold water supplies are plumbed to the wrong sides of the valves.
Shower will not run hot enough when first installed.	1. Check hot water supply temperature. 2. Maximum temperature needs adjusting. See Temperature Adjustment Section. 3. Operating Conditions are incorrect. 4. Blockage in hot side of the system.
Hot water in cold and vice versa.	1. Make sure serviceable in line Check Valves have been fitted. Check and clean them if they are already installed.
Low, or no flow from the Valve.	1. Possible blockage in the system. 2. Operating Conditions are incorrect. 3. Valve being obstructed by debris. 4. Valve shut off has activated due to Operating Conditions.
Leak from Valve in the off position.	1. Debris has gotten into the Diverter Valve.
Fluctuating flow rate.	1. Possible blockage in the system. 2. Operating Conditions are incorrect. 3. Dynamic inlet pressures are not balanced. 4. Shuttle assembly is faulty.
